

Is there profit in regenerative rotational grazing? Let's find out.

Today, many farmers have a keen interest in regenerative agriculture.

These producers like regen's potential to improve soil quality, reduce operating costs and help the environment.

Still, it's worth asking: can you make a buck at it?

The way Backswath Management sees it, despite its compelling soil health benefits, regenerative agriculture still needs to pull its weight in financial terms.

We say: let's figure out what regenerative agriculture can do for your business.

Backswath is partnering with a leading agronomy group to offer a three-year road test in the area of regenerative rotational grazing. Think of it as a business plan for your regen ag ambitions.

Now's the time to do it, too. With funding from the federal government's On-Farm Climate Action Fund, up to 85% of your project costs could be covered.

If you're employing regenerative farming practices now, or are interested in taking regen for a spin, here's where Backswath and our agronomy partner can help. (You also need to have, or have access to, livestock for grazing).

Working closely with you, we will provide:

- A 3-year budget plan for the field(s) you're looking to transition
- Financial performance outlook
- Return-On-Investment comparison of regen vs. conventional rotational grazing in your field(s)
- Access to local regen experts for recommendations on what to plant, optimum seeding rates, water options and how best to fertilize
- Introduction to the OFCAF program to determine what level of funding you might be eligible for.

After three years, you will know what role regenerative grazing practices can play in your operation – and what the financial impact is likely to be.
